

PAT25 ingress diagnostic: original versus deterministic screened access

Recorded attempt status: complete · six fixed source-axis exits · initial uncommitted inventories only

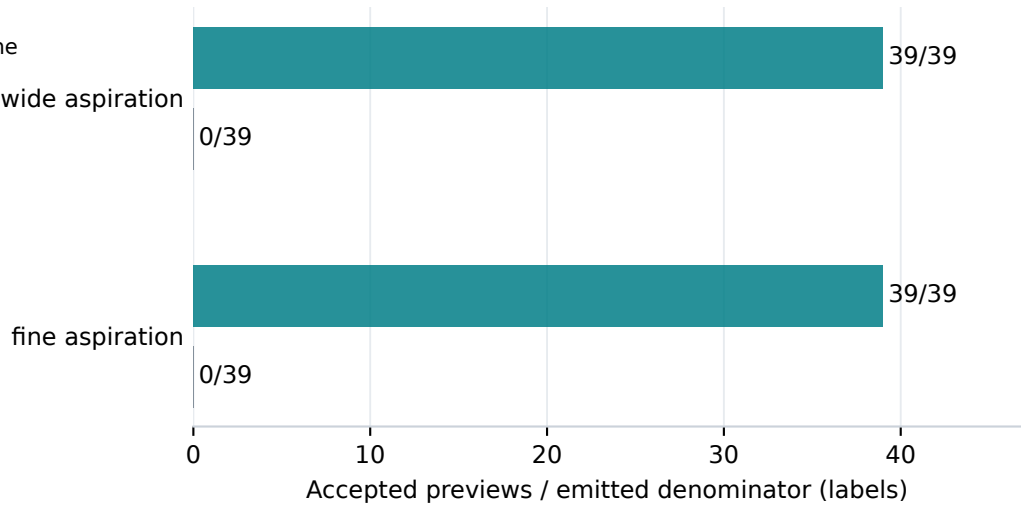

● Original baseline ● Screened selection

A All six exits: static ingress eligibility

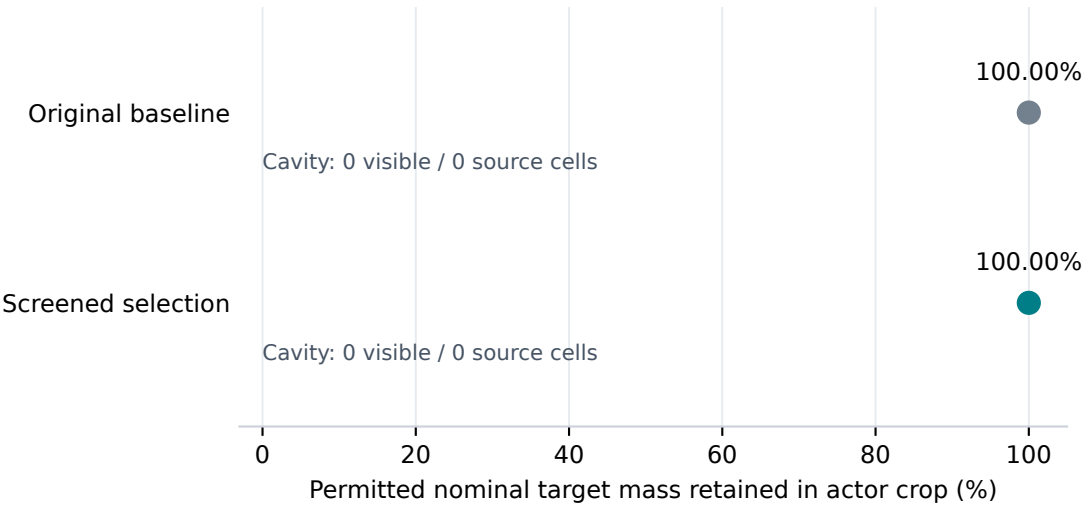

468 returned poses carry geometry unknowns (reuse included). Eligibility does not erase those unknowns.

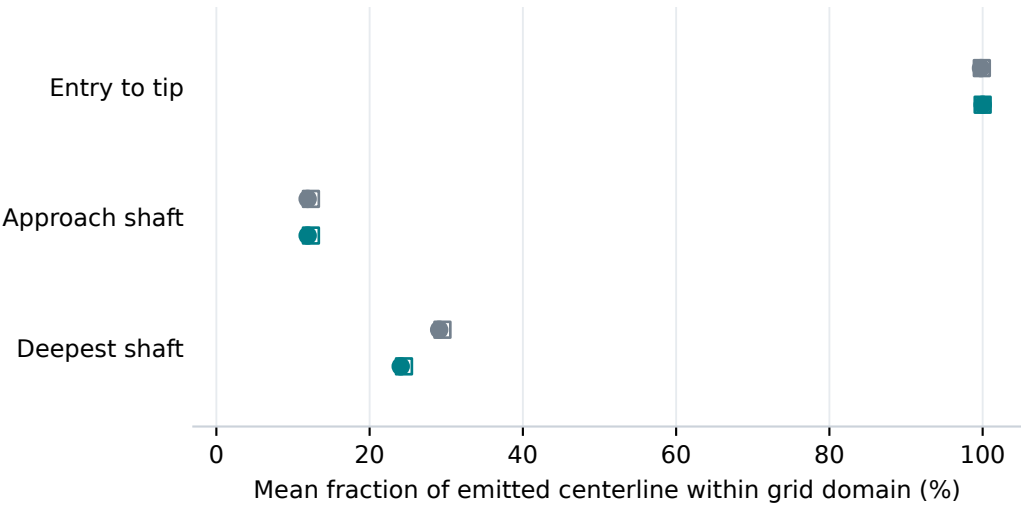

B Full native previews: acceptance by tool

C Actor nominal target and initial cavity

D Actor grid: continuous centerline coverage

Filled circle: center interpolation domain. Open square: full-cell extent. All emitted previews; accepted-subset summaries retained separately.

Preparation diagnostic only: ingress eligibility is not full-stroke feasibility; centerline visibility is not complete-tool clearance.
No committed resection, clinical benefit, model accuracy or learned-policy improvement is established.
