

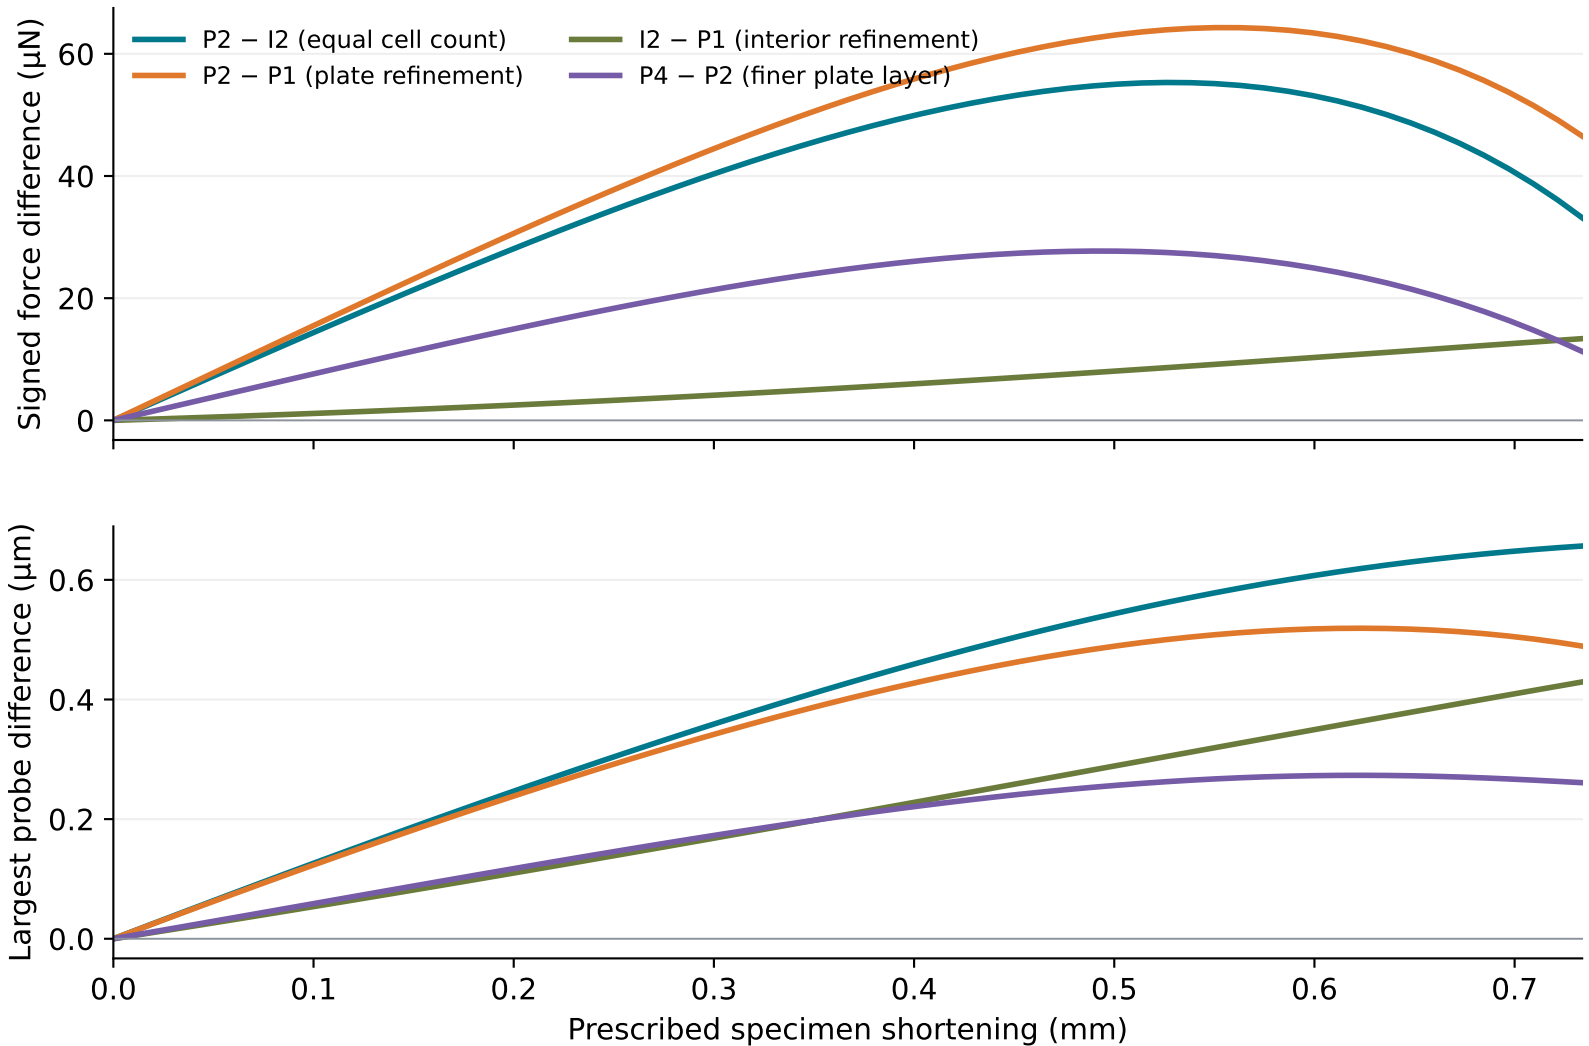

Plate versus interior refinement

Numerical predictions on HBE_01_03 specimen dimensions

Fixed radial grid and 60 load steps; $\mu = 1,000$ Pa is a numerical scale.

Primary P2 – I2: maximum |force difference| 55.31 μN; probe difference 0.657 μm.

These are differences between predictions, not errors against measurements.

Total spatial/step convergence and physical calibration remain unproved.
